Military leaders have always recognized that the effectiveness of Soldiers depends largely on their physical condition. Full spectrum operations place a premium on the Soldiers strength, stamina, agility, resiliency and coordination. Victory and even the Soldiers lives often depend upon these factors. To march long distances in fighting load through rugged country and to fight effectively upon arriving at the area of combat; to drive fast-moving tanks and motor vehicles over rough terrain; to assault and run and crawl for long distances; to jump in and out of craters, and trenches, and over obstacles; to lift and carry heavy objects; to keep going for many hours without sleep or rest all these activities of warfare and many others require superb physical conditioning. Units must be able to operate continuously while deployed. PRT provides a foundation for combat readiness and must be an integral part of every Soldiers life. Soldiers and leaders are responsible for maintaining a high state of physical readiness to support training and operational missions. Units need to be capable of fighting for sustained periods. Soldiers should therefore become experts in the conduct and performance of PRT. This link between training and sustainment is vital to mission success. Once Soldiers and units train to the required level of proficiency, leaders structure individual and collective training plans to retrain critical tasks at the minimum frequency needed to sustain proficiency. Sustainment training is the key to maintaining unit proficiency despite personnel turbulence and operational

deployments. Army units train to accomplish their missions by frequent sustainment training on critical tasks.
