

Tectonic Boundary Conditions for Climate Reconstructions (Oxford Monographs on Geology and Geophysics)

In recent years there has been a movement to break down old disciplinary boundaries in the geosciences to develop a more unified view of the earth as an integrated system, but efforts to integrate solid earth and climate studies have not progressed as rapidly as other areas. Responding to this deficiency, this volume provides an in-depth examination of climate modeling--an area which can benefit enormously from the interaction between solid earth geophysical studies and climate studies. Written by eminent figures from both disciplines, this volume focuses on the role of tectonic boundary conditions for paleoclimate reconstructions. Chapters present background material on the impact of tectonic changes on climate, as well as the uncertainties in tectonic boundary conditions, such as positions of continents, height of mountains, depth of sea floor, among others.
