

## From Warehouse to Supply Chain Inventory Management

From Warehouse to Supply Chain Inventory Management describes how stagnant and inefficient telecommunications delimited the creation of inventory replenishment policies, giving birth to a paradigm that inventory should be managed inside the four walls of a warehouse. EOQ, reorder point, min/max and the rest of current inventory replenishment policies, create batching in supply chains, a well-known cause of the Bullwhip Effect in Supply Chains; while this has been well analyzed and researched, From Warehouse to Supply Chain Inventory Management finds answers to a simple but yet, very important question: Why? Why are we using inventory replenishment policies? What were the reasons forcing its use? By describing how a bygone worldview limited the creation of inventory replenishment policies, From Warehouse to Supply Chain Inventory Management suggests the opportunity to expand the locus of inventory management from the warehouse outwards onto the supply chain. From Warehouse to Supply Chain Inventory Management represents AutoID Consultings perspective on the current state of inventory management tools and lays the foundation for technology solutions that could revolutionize supply chain management.
