

Canonical Babbling and Very-Early Intervention

The last couple decades of behavioral and neurological research have yielded surprising information on infants linguistic skills. We now know that many speech-language disorders can be predicted in the first year of life, most notably from the age of onset of canonical babbling. However, very-early evaluation and intervention is infrequently applied clinically. Canonical Babbling and Very-Early Intervention reviews what is known about speech development in the first year of life and predicts future directions for infant speech-language services. Meredith Poore Harold, PhD, CCC-SLP is a speech-language pathologist and independent developmental scholar. You may reference her work online at www.meredithharold.com.
