

Cognitive Approaches in Neuropsychological Rehabilitation (Neuropsychology and Neurolinguistics Series)

Presenting a new perspective on cognitive therapy in neuropsychology, these papers examine a cognitively-oriented, single-case methodology in neuropsychological rehabilitation. The recommended strategy is in-depth analysis of the precise nature of the impaired as well as the preserved processing components in the individual patient. The objective is to design a therapeutic course based on individual patient needs that is justified by the theoretical interpretation of the location of the deficit in his or her cognitive architecture.
