

Incorporating Corpora: The Linguist and the Translator (Translating Europe)

The emergence of studies of translation based on electronic corpora has been one of the most interesting and fruitful developments in Translation Studies in recent years. But the origins of such studies can be traced back through many decades, as this volume sets out to establish. Covering a number of European languages including Czech, Hungarian, Polish and Slovenian, as well as French, Spanish, Portuguese and Swedish, the book presents many new studies of translation patterns using parallel corpora focusing on particular linguistic features. The studies reveal systemic differences which are in turn, of relevance to the linguistic description of the languages concerned, as well as to translator training. Also included are broader-ranging contributions on the concept of translation universals, including a critical perspective on this popular topic. [127 words]
